Abstract

We report recent observations of *Platyceps rhodorachis* (Jan in de Filippi, 1865) from Kyrgyzstan and the first species record from the Alay Mountains. It represents an important range extension in the Central Asiatic distribution of the species.

Key Words

Central Asia, Colubridae, Coluber, range extension, new records, distribution

Kyrgyzstan is a Central Asiatic country where basic zoological research has been conducted mostly during the Soviet Era (Chernov 1959; Bannikov et al. 1977). Although its territory is part of the biodiversity hotspot of the Mountains of Central Asia, distribution of particular species is poorly known and data are scattered in different, mainly Russian-written sources. The recently described species *Gloydius trickmersi* Wagner, Tiutenko, Borkin & Simonov, 2016 is a good example of how the territory of the country is herpetologically important. Wagner et al. (2016) especially highlighted the importance of the Alay-Pamir region as a territory where herpetological knowledge is limited and based only on several zoological expeditions conducted in the first half of 20th century. Despite recent investigations (Wagner et al. 2016), herpetological knowledge remains poor in the Alay Mountains.

Here, we present the first documented record of *Platyceps rhodorachis* Jan in de Filippi, 1865 from the Alay Mts. that represents an important range extension in the Central Asiatic distribution of the species. This polytypic species has a large area of distribution ranging from NE Iraq to Kyrgyzstan and probably westernmost Nepal (Schätti et al. 2014), where it inhabits a variety of habitats. To date, overall six records of the species are known from Kyrgyzstan, two from the west part of the Chuy Valley (Bishkek area), one probably from Talas Alatau and three following the Naryn River Valley up to the Fergana Valley (Table 1, Fig. 1; Schätti et al. 2014 and literature therein).

Our new record comes from Osh Province, southern Kyrgyzstan (Vidana village located at the canyon of Ak-Buura River; 40°12'47.7"N, 72°58'18.9"E; 1465 m a.s.l.; loc. 8, Fig. 1). The adult male (Figs 2A and B) was recorded on 18 May 2018, around 1700 h local time. The individual was hidden under a large stone located in a rocky habitat with scattered, bushy vegetation near to the river (Fig. 2C). This is the first record in this region and province and is now the most southern record of the species in the country, being located approximately 130 km in a straight-line from the closest records in northern parts of the Fergana Valley (Jeremcenko et al. 1992; locs. 5 and 6, Fig. 1). Concurrently, this record represents one of the eastern borders of the species distribution in Kyrgyzstan and Central Asia. During the same two-weeks long field research in Kyrgyzstan in May 2018, we recorded another individual of *P. rhodorachis* near to Toktogul reservoir, located on the Naryn River (loc. 7, Fig. 1). This record comes from Imeni
Chkalova village, between Uch-Terek and Karakol villages, Jalal-Abad Province (41°46′05.6″N, 72°57′14.1″E; 941 m a.s.l.) and roughly corresponds with the first published record of the species in Kyrgyzstan (Chernov 1959). The adult female was found on 16 May 2018 around noon under a stone on the grassy habitat (Figs 2D–F).

The range of *P. rhodorachis* in Kyrgyzstan has a peripheral character (see distribution review in Schätti et al. 2014 and Fig. 1) and the species probably extends into Kyrgyzstan from steppe or lowland regions of its western continuous range in Kazakhstan (Chuy and Talas river valleys), Uzbekistan and Tajikistan (Fergana Valley and valley of Naryn River). Schätti et al. (2014) expected its occurrence in Batken and Osh Provinces in southern Kyrgyzstan east to the Jalal-Abad region and it is confirmed by our record. Several other species of reptiles have a similar distribution range in Kyrgyzstan (e.g. *Testudo horsfieldii*, *Pseudopus apodus*; Sindaco & Jeremcenko 2008). Verification of the presence of *P. rhodorachis* through the Talas River Valley, beyond western Chuy Valley and eastern territories of the Naryn River Valley in Central Kyrgyzstan is, however, another challenge.

**Table 1.** An updated distribution records of *Platyceps rhodorachis* in Kyrgyzstan.

**Figure 1.** Distribution records of *Platyceps rhodorachis* in Kyrgyzstan. Numbers of records correspond with Table 1. The question mark suggests possible occurrence of the species in Kyrgyzstan (see main text). The known distribution range of the species in Central Asia is highlighted in orange following data of Schätti et al. (2014).
